GH^oSTBUSTERS™ THE COMPUTER GAME.

BY DAVID CRANE

© 1984 ACTIVISION INC.

Yes Ghostbusters is a computer game, too.

The game play follows the film with incredible accuracy even down to the chart-topping music score.

Your task is to rid the world - and in particular New York City - of a cataclysmic plague of ectoplasmic nasties.

Play it well and we give you a Ghostbusters franchise - with your own secret account number. Use this number and the money it brings you, to buy the same ghost busting gear they used in the film. (Don't worry - we'll give you some money to get started.)

You will have earned it. And you can use it to go to undreamed of levels. Don't try to use someone else's number, we'll find out.

From then on, it's you against the ghosts. All the way to the Temple of Zuul.

Where the final battle begins.

Designed by USA's David "Philly" and Decathlon®

Come and running on Commodore 64, cassette and disk and Spectrum. Coming soon on other systems.

MONITORING EIGHTY FIVE was yet to be the year of the 16-bit computer. The home micro boom, which has been almost exclusively 8-bit based, is due to evolve into a more advanced, and possibly more stable market. The days of microprocessors such as the Z80, 6800 and 6801 are, if not already numbered, at least on the wane.

This is not to say that 16-bit computers are either revolutionary or startlingly new, just that up to now they have been mainly confined to business and specialist personal machines such as the Apple Macintosh. Another was arguably the first computer to break the mould with the 4389 QP, based around the 68000 chip. But, many people would dispute this machine's claims to be a true 16-bit machine, limited as it is by an 8-bit bus!

However, Commodore has announced its intention of joining the field with the purchase of Amiga, a small hardware company based in Santa Clara, California. This company has built a 16-bit home computer which is expected to cost less than \$1000 (£710). It should appear in Commodore colours some time next year and might even be on display at the Consumer Electronics Show in Las Vegas in January.

Just to complicate matters still further, Amiga is suing Amiga for \$100m for alleged breach of contract. Amiga had a development contract with Amiga while the latter was still owned by Warner Consumer Systems, though the contract was subsequently cancelled by Amiga.

Given that the Japanese have based their MSX standard on the 8-bit Z80 chip, it makes sense for competing manufacturers to upgrade the specifications of their machines. Perhaps Sinclair, who has just launched its 8-bit Spectrum +, will enter the fray with a cheap 16-bit game machine in time for Christmas 1985. Certainly Amiga seems to be looking at this design.

The wager for defining lowest computers on the amount of RAM they contain may be passing. The new machines could be whether it is 8 or 16-bit — or maybe even 32-bit!

8 EIGHT GOOD REASONS TO GET A DISC DRIVE FOR YOUR COMMODORE 64

THE CLIENT FILE

Your business is dependent on how well you know your customers, and the services they require as a result. The Client File system allows you to enter, summarise and quickly print customer records individually or by character or with alphabetical processing by agents, letters, labels etc.

**NO SETTING UP REQUIRED
JUST FLIP YOUR PROGRAM Disc
OVER AND YOUR DATA BASE IS
READY TO USE FOR ONE OF THE
FOLLOWING ...**

THE BOUNDBSMAN

Your business activities require specific services from regular visits to your customers. Your best source of business are your customers (organized into records) and to produce services you require. (Including the time allowing services information and communications immediately with your clients will automatically help for your performance better your profit)

THE AUTO DEALER

Your best source of business is a customer's best current and past customers. Control of your business system to increase, update, accurate and information. Your files are a valuable and source of information. The system allows accurate current information to become a tool of business with agents, letters etc. able to be produced related to your file information.

THE COLLECTOR

For the better, it is best to use information of the nature of the collection you need to know what you do and where to find it. This program is the answer to your specific needs. It is the only system that can produce reports, labels and letters as required.

THE SALES REPRESENTATIVE

Your life must be a sales of goods to service of a client. Your best are products and customers and your success depends on the quality of information you have on each and how you relate your products to your customer needs. Producing personalized letters and reports for your collection will show your business results.

THE STOCK FILE

The Stock File is a really fast thing to use, a file system and a word processor. You can set up and manipulate files and then produce reports and letters with information from these files. It is a stock list, price lists, quotations etc.

THE MEMBERSHIP MANAGER

There are many ways to a typical member of your club group or society. You need to manage them by any number of parameters. You need to know before their membership expires, you need to know if they are subscribed or if they need to be renewed personally by telephone or letter to each.

The Membership Manager puts you in control of your report list and members and more.

THE REPAIR SHOP

There are many ways to repair the products of a profit. They probably have a list of the products which you give you the edge on the competition. With this system and your special skills you can keep records on customers' products, repair jobs and history of parts on your own shop. You can produce labels and a price list for your customers.

☐ Until now a Data-Base Program to perform any of these tasks would leave little change out of £100; add the extra for a Letter Editor and you will have even more room in your wallet or purse.

☐ Only £24 plus V.A.T. for the ABRAXAS Data-Base Manager of your choice.

REMARKABLY VERSATILE

Look What You Get

☐ The Data-Base Management System can record up to 1000 screen size "Record Cards" (per data disc) on any information you want.

☐ The system has a built in calculator so it can record and calculate costs, profits and amounts etc.

☐ Records can be displayed on the screen or printed using the report feature. It will sort and produce mail lists, price lists, delivery reports etc., in any order you require.

☐ In addition some 26 single page letters can be stored for instant recall on each data disc and there can be as many data discs as your business or interest demands.

The Data-Base Management System will run on your Commodore 64 and SX64 Computer

Our London Office will be operating from 15th November 1984.

D-I-Y reset

I HAVE managed to construct a very simple reset button for the 41 by connecting a push-to-complete switch across pins one and three of the user port. Pressing the button has the same effect as SYSRST, but of course is independent of the keyboard, so any **ILLEGAL OPERATION** displaying pages are rendered useless.

Construction is as complemented as you like, my switch cost 50p and took only three quarters of an hour to assemble. This however is the lower model, and the "service" can be made for nothing at all using a (cheap) piece of wire or a paper clip! The pins need not 1 (ground) and 3 (reset) ONLY, use pins A and C underneath the board.

Crescible clips with the lower jaw taped over, or pieces of edge connector can be used to wire up the pins, and the effect is to return the 41 to Basic. You could then, for instance, **ENTER ADDRESS 2040 to 2047 to look at the screen** — the rest is up to you!

THANK YOU for your interesting and helpful magazine, which is available every month in New Zealand, unlike some such as *Computer* which we have not seen since April.

A plea for overseas readers — we don't have enough time to state your contributions by the end of the current month.

We run a very economical User Group and have a library of cassette and books and a 1500 printer/plotter. tapes can be borrowed freely, and as a club we can afford to buy more programs than people could read individually — although they send a small donation here, (average games averaging \$75-\$95), though good cassette games have come down recently to 120 95.

Please, more educational programs and programs for the 1120.

Beating Beach Head

WITH REGARD to the letter on *BeachHead* from Ian Davies of Mid-Claremont, high scores can be achieved due to a slight glitch in the tank section when the pink

screen tank appears. Shoot it and keep shooting at the 1000 point score flash — it will add 1000 points each time you hit it. (It doesn't leave it too late or you'll crash).

My high score on *Beach Head* is 156,600.
Sean Miller
Hemel

WE'RE STILL pondering whether to include a high-score section in *Horizons*. Any comments?

Back- answer

I REFER TO THE "reading" technique for Basic programs, described in *Answer Back* in August.

I tried out a pilot program on my Vic, and found that the new program would retain all numeric variables correctly from the old, but that with string variables the string being stored frequently be retained. I would be most grateful if you could let me know how to overcome the program on the Vic.
John W. Davies
Chelmsford
Hemel

THIS answer relates to all Commodore machines. If a string is defined in the text, then that string is taken from the text upon program execution. However, when you load another program that text is overwritten, and that replaces then only apparent garbage.

When a string is created by the program, then the string

is stored in high memory, growing downwards from the top of Basic.

These are safe from being overwritten by BASIC from within a program.

The answer to your question, then, is to realize the string without changing it, and the unchanged string will remain in high memory. For instance, if your program line reads 100 GOTO "NAME", then enter the 100 to read 100 GOTO "NAME" all = all = all.

The "all" is all, and has no effect on the length of the string.

Time, gentlemen...

JOHN WORTH in reply to John Worth's problem with *Polypipes*: When you get to the danger sign, throw your paving slab and continue north. After doing this you can return to the trap, say something, and search for them.

IF THINGS go on like this, we'll have to start up an adventure column. What do you think?

This is the chance to air your views — send your tips, suggestions and complaints to Letters Page, *Commodore Horizons*, 15, 15 Little Market Street, London W6R 1LD.

NEWS DESK

Tymac all talk?

TYMAC TALKES look like making a big impact on the Commodore software market, when the games, which incorporate speech effects generated with no extra hardware, are released in the UK.

Tymac's origin is as a manufacturing of precision engineering tools in the USA. From there the company drifted over to become computer peripherals, and now a range of Tymac software is to be marketed by a UK firm.

Speechman *Spoken Sage* explained that the speech routines, developed specially by Tymac, add an extra dimension to the games without adding the cost of speech synthesiser hardware. Moreover, Tymac's graphics routines are very impressive, especially on the 20 games like *Samurai*, an exciting martial arts battle game, and *Darkness Descends*, an underground treasure mission featuring colourful perspective graphics.

Tymac's first release will be *Flare Fox*, which was the subject of negotiations with the US Gold label at one time. *Flare Fox* is a combat flight simulator in which you control a fighter assigned to defend airbases against enemy attacks.

Other forthcoming titles include *Castell*, a regional arcade adventure, *Pegasus*, based loosely on the scenario of the film *Clash of the Titans*, *West Bank*, a nuclear war simulation, and *Type-3*, a typing tutorial program which is actually free.

Tymac games will be £14.95 on disk and £9.95 on tape. Contact John Sage, Tymac Northern House, Callinings Road, Walsbyre, Rotherham, 440 1076 for further details.

CBM's spirit of adventure

COMMODORE's new book-and-software bundle adventure *Spirit of the Stones* offers all sorts of promised "adventure", as well as the chance to win a share of the Kennedy Fund based on the number of units sold.

The book on which the program is based is by John Wainley, and is set on the Isle of Wight. The supernatural adventure, involving smugglers, marauding ravenous men, and hidden *Atlantean* cities, offers clues to the location of the prize on the Isle itself — but you don't need to travel to solve the riddle and find the treasure.

The book was released in the South of England six months ago, and already four of the promised prizes have been found. When the Commodore

book-and-software package is published (the ship out in November), it will include more

clues in the weekly puzzle, which features a winding map of the island and 21 treasure

locations showing and giving blocking your attempts to find the diamonds. The problem is by Ian Grey, responsible for many of Commodore's most successful programs, and Les Brown.

Before the treasure puzzle reveals code letters which must be compared with the usual clues in the book to unravel the mystery of the hiding places of the treasure and the Great White Lys.

The treasure is a ship-based package will cost £14.95, and £6p from each sale will be contributed to the Kennedy Fund. The Fund will be divided with one share going to each holder of a volume, and one to the holder of the Great White Lys. It will be closed in 1990, or at £1m, or when all the treasure have been found.

Dynamite database

IF YOU HAVE a use for a 64 database program, but don't want to pay 20 or 60 pounds, *Dynamite Software* might have the answer with *Database 64*.

The tape-based program costs £1.99, and allows up to 30,000 records with 15 fields per record, 25 bytes per field and 255 bytes per record. The *Database* is menu-driven and contains management help messages. Sorting, searching, add, delete and insert are fully supported.

Dynamite also offers a 64 *Access* editor/diagramming package, which allows variation, labels, pseudo ops and control commands. The *Access* editor will deal with any part of the 64's memory, including the operating system and Basic interpreter.

The *Access*/Editor/Diagrammer costs £1.95 on tape, and comes with a manual.

For more details of these and other *Dynamite* packages, contact *Dynamite Software*, BCM 8711, London WC1N 1BN.

Vic on video

IF EVEN the best programming talented book lovers are in the dark, perhaps *Master Class Video* can supply some illumination.

There are four videos in the *Commodore* programming series, *Vic 20 Level One* and *Two* and *Commodore 64 One* and *Two*. Each of the four-hour courses is presented by David Roddick, who demonstrates screen and keyboard techniques, data entry, and

more advanced programming techniques. As a bonus the manufacturers of the courses contain *Power* programs which can be loaded onto the computers. The video courses are available in Betamax and VHS formats, at a cost of £29.95.

For details of these and a range of other packages, contact *Dynamite Software*, BCM 8711, London WC1N 1BN.

LVL in tune with Echo system

FOLLOWING two months' release of Cambridge's Music Maker atop the keyboard for the 64, hardware specialist LVL takes another approach with the introduction of the Echo 1 (all-new mechanical keyboard).

The Echo-1 is a three-octave unit with a wood and metal case, costing £99.95.

Also available is an amplifier output kit, EchoKit, which enables you to connect your 64 to the £19.95 Echo-1000 amp-speaker unit. This,

firstly, 6-inch dual cone drivers has volume and tone controls and a wooden cabinet.

The Echo 1 keyboard comes complete with a software package, Organ Master which allows preprogrammed and real time control of the 64's play. Additional EchoSoft packages are in preparation.

We hope to carry a full review of the Echo system in a forthcoming issue.

Contact LVL, Scientific House, Sandhurst, West, England, GU8 5JX for more.

Oswald, Erik and Jim's adventures

Mosaic and Jones go soft with Mosaic

MOZAIK PUBLISHING has announced three more "book-ware" packages based on best-selling paperbacks.

The Saga of Erik the Viking by Henry Prynne and and medievalist Terry Jones, contains a 64 program and a 26-page booklet. It's a new adventure programmed by Level 5, coming £9.95.

Harry Harrison's The Stainless Steel Rat Saves the World is an illustrated two adventure complete with a

copy of the infamous anti-spinal paperback starring slippery Rat D'Kiss, the galaxy's nastiest criminal (and secret agent). Cost is again £9.95, as is that of The Sound of Time, an illustrated sci-fi adventure based on Michael Moorcock's Donald Barable series. Programmed by Shards, The Namead ... comes with a 36-page booklet.

Contact Mosaic, 187 Upper Street, Highbury, London, N5 2DA 0222.

Mirrorsoft seeks the practical touch

MIRRORSOFT, known so far largely as a producer of games aimed at the young and of the series, has branched out into "practical software". The Home Discovery series is a series of five programs for the 64 and other machines and comprises a weight control program, "The Jolly Plonk", a "Save your Own Prescriptions" package based on a book by Hans Jynck and Gert Wilcox, "Save Your Own Feet" a protein utilising program by Cliff Sengco, Head of Experimental Psychology at Cambridge, "Star Trekker", an astronomy program developed in conjunction with the London Planetarium, and "Mastermind" the program of the

programmer/country BBC TV. Most of the Home Discovery series has been written by Ivan Gray. Software Contact

version will cost £9.95 and disk £12.95, and the packages will be available until order from Mirrorsoft.

Home Discovery - 64 know what?

Supabasic offers 72 extras

INTERCEPTION, best known for arcade games for the 64 and Vici 20, has made its entry into the software market.

Interceptor Supabasic is a BASIC interpreter package adding 72 programming commands for the 64. Areas covered include binary graphics, sound, sprite control and programming with a 40-page manual.

Supabasic sets a precedent by being available at the same price for disk or cassette version — £9.95.

We'll be reviewing Supabasic in a future issue. Meanwhile contact Interceptor at Linden House, The Green, Tetley, Highbury for more details.

WOW! THIS
COMMODORE 16
STARTER PACK'S
WIZARD!

And cwikey! i

First we jolly well put everything you need to start home computing into one box.

Then we placed an obligingly low price on it all under £140 for a computer, cassette unit, a super programming course and 4 great games programs.

Boys and girls (of all ages) will just love the Commodore 16 Starter Pack!

The computer has a 16K memory, real type-

writer keyboard, 128 colours and also superb sound and graphics.

It uses BASIC (this is the language in which you and the computer "talk" to each other, right ho!)

The BASIC used by the Commodore 16 is very advanced, yet really simple to use. That is because it gives you more programming commands.

But just in case any of you fellows do have any

it's only £139.99.

difficulties, we also provide you with a Help key. This helps to sort out programming errors by showing you exactly where you went wrong.

So you can get more out of your Commodore 16, the Starter Pack also includes "Introduction to BASIC," a guide to programming that any silly chump can follow.

And so you can get more enjoyment, there are

four jolly good and splendidly challenging games: X-Zap, Pundry, Picture Builder and Chess.

If you are thinking of starting home computing, there has never been a better time than now, with the Commodore 16 Starter Pack.

No matter what age you are, old thing.

Pulling the switch on Vic joysticks

Colin Wells explains how to program the switch joystick

WHEN THE Vic 20 was first designed, it was intended primarily as a games machine. While it can be used for other purposes, the Vic is supplied with a selection of features with games in mind. One of the most useful and widely applied is the switch joystick. This is quite cheap, rugged and simple, but provides a versatile means of moving things around the screen.

The switch joystick is composed of two switches, each of which, when closed, connects an output pin to ground (in DV, logic 0). One switch is connected to the "Yen" button (often at the end of the stick). The other four switches correspond to the four directions of stick movement: "north", "south", "east" and "west". These four switches may also be operated in pairs, corresponding to the intermediate positions (ie north-east, north-west, south-east and south-west).

On the Vic, the joystick is plugged into the nine pin connector on the side of the machine. The pins are numbered left to right, top to bottom and used thus:

```
pin 1 — north
pin 2 — south
pin 3 — east
pin 4 — west
pin 5 — pin 7 (female)
pin 6 — pin button
pin 7 — 4.7k resistor
pin 8 — GND (0V)
pin 9 — pin 7 (female)
```

Armed with this information, the code were described below and a suitable plug (it's called a "pin" Cannon D" (female) is the trick), connecting any one of up to five switches to the Vic could not be easier.

Since the joystick is so useful and the hardware so simple, it's a shame that the designers of the Vic didn't make it easier to use from a BASIC program! Everything is OK if you just want to look for north, south, west and fire. These are connected to bits 1, 1, 4 and 1 of port A of VIA #1. This means that PEEKing \$100 (\$A00) gives access to this data.

If you want to detect the joystick on the east position, it's a bit of a problem. The

switch is connected to bit 7 of port B of VIA #2. This would simply be odd and a bit inconvenient, except that this pin (all 8 bits) is used for output to the keyboard matrix.

To overcome this problem, it's necessary to change the direction of the bit stream (consequently by PEEKing a 0 instead of 1 of the data register requires the pin a value of 027 instead of 0154, 0010, before PEEKing \$100 (\$A00). Don't forget to POKE the direction register back to 255 as you'll find that parts of the keyboard don't work! A side-effect of this rather odd design is that some keys (2, 4 and 6) don't always behave totally when ▶

Figure 1 contains a sample BACAC job contract to direct the provider. On most days, the variable *L* contains the set as follows:

Year	Age	Sex	Occupation
1990	18	Male	Student
1991	19	Female	Teacher
1992	20	Male	Engineer
1993	21	Female	Doctor
1994	22	Male	Lawyer
1995	23	Female	Artist
1996	24	Male	Scientist
1997	25	Female	Writer

The program in Figure 3 loads a machine-code version (near the top of memory) (any case). This is faster and more compact than BASIC and may be invoked by

It's worth noting that, if you abort the BASIC program using RUN/STOP, it's possible to end up with a partly-damaged keyboard type RUN/STOP-NESTORE in case of a Walk the machine-code version, then, can't happen.

Although the above technique does simplify deriving of graphics on the Vax, it still isn't as easy as with some other computers. With the 64, for instance, it's only necessary to PEEK a location to read the physical picture; C++ can be made to do this with the Vax.

The answer is "Yes", by implementing a "background" program. Such a program can run every so often, independently of any BASIC program being run at the time. The Ym runs some code every sixth of a second to update the time, scan the keyboard, flash the cursor etc. Fortunately, the Ym operating system is designed such that an alternative program may also be run at that frequency. I have included two variants on this theme.

The program in Figure 3 loads a background program which scans the payload and places the result in the form used in the program in Figure 1) in location 00A0000. See, to read the research note.

The alternative loaded by the program in Figure 4 places the result in the first variable defined by the BASIC program (which should be an integer). For example:

```

M=0; n = 0
DO WHILE T=1
  M=M+1; n = n+1
  PRINT "The average value continuously on
the screen"

```

The second of the two variants had the advantage of speed, since an integer variable access is faster than a PEEK. In both cases the background program is killed by **MINI-SUP RESTORE**. They can be executed by **STD.ATT**.

At least the other companies I won't say which, but suffice it to say that it's not a Commodore but a personal computer connected with the keyboard screen directly. This means that the joystick may be chosen for the keyboard, or vice versa.

The program in Figure 5 loads a background window to achieve a similar effect. The row values in the DATA statement in line 975 represent the ASCII in CHESS codes corresponding to file, rank, south, east, west, north-east, north-west, south-east and south-west, respectively. The *Key Input* takes procedures over the disk directions. With the given values, the program moves the cursor around, north, south, east and west, by simulating the cursor control keys.

This approach is really my favorite. The main advantage is that programs may easily be written to use the joystick or keyboard with an advantage: it would, therefore, be simple to add joystick control to a program written to use the keyboard. Again, the background program may be killed with RUN/STOP (A1-512050) and reloaded with 553-873.

I maintained rather than any five meters could be connected to the VFO using the popular interface. This is quite a useful technique since a five meter supply is also available on the same connector. It may be made even more flexible by introducing some level control.

This is simple, because the VTA may have its functions configured by software to be inputs or outputs, as any combination. This is only possible with the four connected to VTA #1, since the other two are only "borrowed" from the keyboard, when required. The program in Figure 4 registers all four from the pins 1, 2, 3 and 6 of the connector between input 0 and 4, with a period of about a second. ■

On the wing

A flight simulator for people who can't afford flight instruction. Having assumed the responsible Sublight Flight Simulator 1, and ploughed into the ground image a time with Digital Anagrams' Flight Pilot, I'm just as relieved as anyone to see a flight simulator stepped off its completion.

In *Wing Commander* you must pilot your plane in a confrontation with enemy bombers intent on destroying important civilian and military targets. With the help of a radar map, a clearly represented enemy, and various on-screen stimuli, messages, and warning displays, you can get the feel into your sights and have the pleasure of blasting them out of the sky.

Not too complex graphically, but a great game to play in Christmas. Really good for younger players, and not bad for old gamers too like me.

Puffed out?

Puffin's Fighting Puffins gamebooks have made a fortune for authors Ian Livingstone and Steve Jackson, and have made me very jealous. I had the idea years ago, but they beat me to it. You take on the role of a fearless adventurer, and with rolls of a dice and choices selected from a small menu, you make your way through the adventure, either achieving power and meeting your doom along the way.

The books are excellent, but it is a weakness in the Puffin software packages that they each go too closely to the same format. This means that you have to wade through reams of text before you come to the point where you have to make a decision,

Soft *Hits*

and breaking the bytes

and even when you make a choice all that really happens is that you see a mediocre picture of your situation and watch simulated dice roll.

If you've got the books, the software doesn't add much to the fun.

Carted away

This would have been a good idea, but Asteroids must get used to the idea that the general standard of computer games should be much higher than that of video/adapted. In this one you pilot a fighter/bomber, seen from above in a steady as you go along a narrow valley. Bombs can be dropped out, tanks and enemy fighters avoided or ripped, and various hazards such as balloons and birdships await you.

You can start at any point in the game, and there are various skill levels. You must destroy at fly over fuel dumps to refuel — a bonus and狡猾 game feature, it's always read to me — and that's about it.

This is one case where although the game is enjoyable to play, it's despite the graphics and sound, which are extraordinary, rather than because of them.

Gnurds

It's a long time since Tasknet licensed a game, though they seem to have weathered the long, hard summer well.

Peter Foster isn't their boss, but he's still very ahead of many competitors.

Bill Stickers: Foster Foster excels at more, more manoeuvres, more and more through the streets of — Wellington? — making your way through the streets of Wellington.

The difficulty is in climbing the ladder and making your best of power up to the right order. There's a brilliant ascending effect as the power keeps on, and having achieved one makes you have to move on to the next one.

As it used to be Tasknet, great graphics, steady music and a better sense of humour. Which one is the best? Well, no — it's a pleasure to be even better.

(PS) — Gnurds looks like it's going to be one of the best.

Nest is best

Apple IIgs, any IBM, Amiga, Atari, Spectrum, etc.

This one was a winner when it came out on the Spectrum, but big as many other games seems somehow disappearing in the air.

The 3-D effects are good, depicting a landscape, named you inhabited by imaginary men. You can choose your point of view, watching from one angle to another so that you never lose sight of the protagonists as they roam the city. You can also choose your sex, which is a great writer's gimmick from the point of view of the two or three girls who play computer games.

Armed with grenades you explore the city, searching for your beloved and bombing the area. The Spectrum version of the game contained all sorts of surprises — hidden ammunition caches, secret rooms and so on — whether the 3-D version has the same, time alone will tell. Certainly worth having, though not as outstanding now as it might have been had it come out 6 months ago.

A digital fast lane racer for the Atari 2600, but having lost

Tom Crowder (all great winners), Barker Baga looks comparatively limp in his' through — it's well worth checking out. It's all the usual business — spaceships with propellors and laser guns, flying through a grotesque landscape avoiding laser beams, riding down, flying across and avoiding laser fields. You can also collect fuel crystals to recharge your spaceship, and if you delay too long between crystals you'll take a nasty tumble.

There are 99 crystals to collect, so Barker Baga should keep a few people busy for the month to come.

Cave man

The latest from Bubble has a not very...wholly original, but focuses a few good traditions (if you see what I meant) and most of it makes Chameleon of First.

There are 31 screens to explore, and it's the usual business of climbing ropes,

negotiating man-eating plants and flying snakes, and sticking within the time limit for each one.

Laudably, the number of lives you start with can be set from 1 to 99, and you can start in any state at a variety of vital levels.

Not a classic, but well worth checking out for those of you who like a game which certainly isn't to be defeated in a single sitting.

Jolly Wallie

You number of the classic Mole/Mole Wallie/1st for Sluggo table, but an excellent game for all that. Traffic Wallie, who looks like a carefree little orange cat, hops around a whacky super-market collecting goodies and avoiding gofers. Every five items he must go back to the checkout to unload.

Hidden levels open doors and vicious wolves fly around menacingly. Best of all, though, there is a great music score featuring Popcorn and Dave Michel Jaws's greatest hit.

Good snoring and a large playing area. A man of the size of game is your bag, or if you like good sounds only.

Splitting Images

VIDEO DIGITIZING systems, which allow the output of a video camera to be transferred to a computer screen, have been around for many years now, but mainly in the guise of research projects or very up-market graphics systems. Digimaster has now produced a version of its Macromaster I system which interfaces with the Commodore 64, and which (depending on your affluence), is within reach of home users as well as professionals. The digimaster costs £280, but if you have your own camera, you can expect to knock £100 off the price.

The system supplied for review consisted of a video camera and tripod, the interface box, connecting leads, manual and software. The camera is a black and white TEC Hargrave 40 model. If the name of the manufacturer is unfamiliar to you, then it is worth mentioning that many hotels and organisations use Hargrave hand-held cameras, affectionately known as "fishies". The model 40 is at the other end of the range, however.

It contains a Vidicon picture tube and is fitted with an 11.4 lines wide x 10.5 lines (vertical) distance of 10 inches. The electronics handle the signal levels, so in order to obtain the best contrast range, it is only necessary to adjust the gain. Although this sounds like an advantage, it would help if gain and black level were adjustable. The connections to the camera are a mains supply and video lead — a BNC type video leads the interface to a supplied lead.

The sturdy aluminium box containing the interface electronics, called Macromaster measures 10 by 7 by 1 inches and has one external control — which is only a power switch. A Digimaster video camera shaped

upside up and from the box, and mains must be supplied via the European connector. Inside the box the quality of construction is high, with all the wire power supply traces mounted on a double-sided circuit board. The majority of the active components are TTL chips, but in the heart of the circuit is an analogue to digital converter IC.

Connecting the interface to the Commodore is achieved with a cable that plugs into the user port. But, the lead provided with the review machine could be plugged into the computer's serial device, as no pin-to-pin lines were fitted. On a pin-to-pin system this is impossible, and it will only cost a few pence to correct.

Describing the manual and software that will come with production systems is difficult, since we were provided with pre-production copies. The prototype software was supplied on disk, but a subsequent software will be provided on cassette, with the facility for making disk copies. The manual consists of 30 odd pages (bound in an A4 folder, but more related to an earlier system for the PET, with a few pages referring to the 64 version. If the final result is as comprehensive as the PET manual then it will be quite adequate, though not designed for inexperienced computer users.

The way that the system works is both interesting and clever. For readers who are not clear about the make up of a video picture, I will give a brief summary, as this is required knowledge if you wish to understand how the Macromaster functions. The signal produced by a video camera is a series of lines of picture information interspersed with horizontal sync (line-clearing pulses). First comes a long pulse that indicates the start of a new field, then a line pulse signals the beginning of each line of video line-by-line information.

Connecting up correctly, the image is built up a line at a time from the data. Each line takes 64 microseconds (no scan and 100 lines a half), but less (about thirty lines)

then to build up the field, which takes a portion of a second including the first pulse. A second field is required to make up a full video frame. The lines between come from between the first set of lines, this method being called interleaving.

When the Micrografx interface receives a sync signal it starts for the beginning of the next frame. When this arrives the A/D converter is fed the brightness level of the beginning of the first line of the picture. This is converted to a parallel digital signal that is then passed to the main part of the computer, where software handles the information, moving it to the next use. More than 40 to 45 bits data is available, giving 128 discrete levels, but only four bits are stored by the computer, resulting in 16 different levels. One bit of picture has been stored, but this takes time, and by now the video signal is giving values from much further along the line. The interface therefore waits for the next line pulse and repeats the process on the first dot of the second line, then the third, fourth and so on. Finally, 256 dots having been stored the rest of the field is ignored.

When the next field arrives, which is vertically displaced because of interlacing, less time enough for three pictures) has now remained and stored on the next summer as before. The only difference is that the sample of video information is taken from a line further along the line.

After the second field has been stored, therefore, the computer has two adjacent sets of data stored, corresponding to the first two left hand pixels from each line. The data contained in each field is processed until a full width picture has been stored, consisting of 128 by 256 pixels, each recorded to 4-bit accuracy.

Limited resolution

It is at this point that I must admit to misunderstanding you. The description of the interface does not take into account the limited resolution of the 64. "What?" I then say very "The 64 has a very high resolution." I agree but not quite enough to handle 194 lines and include some form of error scaling. The software for the interface already attempts to push and ignores some on the bottom, giving 100 pixels vertically, and also does not bother with more than field, so the horizontal resolution is 121.

So much for the theory, how well does it work in practice? With a few reserve lines, the answer is "very well." Once I had looked the system up to the computer, I loaded the software from disk. The first step is to load and run the initialization program. This takes a good deal of machine code into place and then asks if you have a dual or true system. Once you say, the second program automatically loads from the correct source and runs fine.

After another delay for more machine code initialization the 64 switches to the high res mode and clears the screen. Now you need to refer to the manual once again as the prompts appear on the screen, but operating the software only involves the function keys.

F1 results in an image from the interface. The VIC chip is switched off, so that the CPU is not slowed down and images are more accurate. For five seconds you are presented with a black screen, while the 64 is grabbed, and then a 128 by 192 picture is drawn on the bottom left hand corner of the screen. This is a fairly large image with noisy scaling, and only takes a few moments to produce.

It is at this point that I realized that adjusting the camera was going to be a rather long-winded task. So, to speed things up, I loaded the video output through the auxiliary input of a VCR, allowing me to view the camera image on a TV and adjust it quickly. Once a well exposed, acceptable picture was coming from the camera, the results of pressing F1 were more encouraging. The image data is only read in by the one function, and is stored in a 128 table.

It is at this point that a display is developed by pressing F2 — the mode for 99 produces a larger, shaded display. This display is not the full screen width, as the 128 pixels are divided in width, and this leaves 64 of the computer's 100 available pixels with nothing to do.

First results of using F3 were impressive, but could be improved with the aid of the third function, F4. This allows the user to adjust two variables used to produce the image. Threshold can have any value between 0 and 255 and affects the overall density of the picture. Increasing this value gives a darker image. Contrast affects the spacing between shades of grey, and can have a value between 0 and 15. Pressing F3 enables you to do this display, where the computer prompts you for new values.

At this point a bug in the software caused an ugly head. Even when specifying what I thought were valid values, the software occasionally stopped with an "Illegal Quantity" error message. This would not have been too disastrous if I had been able to restart the program, but some of the machine code must have been corrupted by the error, so each time the bug appeared I ended up restarting the program. (I should note, that the error

software is still in the prototype stage, so I'm sure this will be sorted out.

When the values are accepted, you are given a quarter screen view of the effect of changing Threshold and F5 will then display the image using the new variables.

The final function, F1, will output the large picture to an 8-pin dot-matrix printer using dot-matrix graphics. Without the correct printer, I was unable to check the results. This is the only way, apart from photography, of preserving your master-print in picture. I am assured that the final version of the software will include a tape and disk save and recall function, and that it will also be possible to "export" the image to one of the graphics handling packages for further improvement.

Lighting problems

Problem! Lighting. I-D objects so that they are very evenly illuminated and have a narrow vertical range covers some 100 exposures. With a correct camera range of 18 to 1 and a developed range of 4 to 1 much improvement was involved in bringing out details. Two-dimensional images were fairly easy to store if you only want two-tone results, but if grey scaling is desired then careful balancing of subject matter is necessary.

A secondary problem was caused by the camera supplied, which suffered from shading on the corners. The system does not sample the whole frame — the bottom of the frame must be ignored because there are too many lines in a standard video signal, and the whole must be corrected accordingly to maintain the correct aspect ratio. The spirit of this is that the camera shading on the top left corner is uncorrected, and often proved disastrous to "light me".

Another piece of software that will also be available with the system over the multi-colored is a mapped mode of the Commodore 64. Therefore, colours will replace the 16 density method of an production, with the choice being left to the user. In fact, the software becomes a really a question of demand. If you are unable to change what is applied to most your work must then (I suppose) may well be able to help.

One experiment which I'm not yet taking a full frame from a video recorder. My particular machine does not provide a very stable linear frame, and yet the results were possible.

The hardware part of the system performs some very exciting possibilities. With the right software, Micrografx will be able to carry out many practical tasks, and home users with sufficient money will find the system a fascinating and all-seeing addition to their Commodore 64. ■

Red Victor Leader Bandits 2 o'clock high

Chris Jenkins interviews Steve Lee, author of *Falcon Patrol*

WHEN WE talked to Steve Lee at luxurious Sunshine Towers he was going through a period of unforced idleness.

"I've just moved house, and the builders are still working on the house. Every time they are up their diggers all the time blow, so at the moment the 64's out of scope. I'm spending the time doing it."

In fact, Steve built this working as a full-time games programmer has to go and down. "The neighbours can't make me out — I get some very funny looks when I tell them what I do. They assume because I'm around the house all day that I'm just idle."

It was another period of unforced idleness which encouraged Steve to become a programmer in the first place. "I had a computer around A level — the only one at the time that I was not good at — and my natural experience with computing was using a ZX81. I then moved on to the Vic 20, and started writing games because I was interested in graphics. Unfortunately, I was mostly redundant, so with nothing better to do I tried selling some games — the first was *Tornado*, to Quicksilver."

Steve's early efforts *Tornado* and *Skyskank* were written using the Vector cartridge, which the benefit of a paper or disk drive. "Everything was written down on paper," Steve recalls, "but I was very pleased with the results. My next game, *Missile Mercury*, included a 'score' routine on the unexpanded Vic. That's the main claim to fame. It was very much a version of *Space Invaders* — all the games house had one — and Virgin offered me a contract based on it. By that time I'd got hold of a 64, one of the first in the country, and I was looking how to use it, which was hard work because I didn't have full documentation. The working that way I got to know the machine very well."

Steve's first 64 game, *Falcon Patrol*, became an instant classic, and set a precedent for Virgin Games — people

actually liked it. "When Virgin went into the games business people around them of buying their products, because they were a record company. I don't think it was ever the best, and in any case the champagne's quite different now — if you look at the ads you'll see that they're purely descriptive, none of the 'magazines' and 'sponsors' stuff."

Falcon Patrol was chosen with great success at the American Computer Electronics Show, and went on to become one of Virgin's best sellers. "In fact, although I haven't made a fortune from programming, *Falcon Patrol* did finance my move to the new house. Now that Virgin have cut the price to £2.99, they're selling huge quantities and orders, and I get the same payment from a £2.99 mail order sale as I would from a £6.99 shop sale."

Falcon Patrol is arguably a *Star Wars* variant, but there are crucial differences. Firstly, the background is so detailed that the game is worth seeing just to watch it scroll by. Secondly, there is a certain amount of strategy involved in using your radar display to creep behind the enemy fighters and blast them before they can blast you, then in looking to reload and move before the next wave comes along. "I wouldn't want a straight shoot-'em-up without an element of strategy," says Steve. "I just wouldn't interest me."

If there was a problem with FFI, it was that you can escape without clearing enemy fighters, for long periods without anything firing, just running out of fuel and watching the landscape scroll by. However, in compensating the designers cited took papers from *Tornado*, and the attention to detail from of Steve's interest in graphics, *Falcon Patrol* made a big hit. Virgin considered Steve for a sequel immediately, but Steve's next effort was not an entirely different track.

"I wanted to do a more game, but I also wanted to add an element of suspense to offset the violence. So I came up with *Hudson Bell* and the *GL-Guards*."

Hudson Bell is a sort of off-beat version of *Indiana Jones*. "He another character he could be a wally," says Steve, "but I like him. I might even use him in another game. In fact he's based on a mythical character from my youth. A bunch of my friends had T-shirts printed up with 'Hudson Bell Lee' and so on — we were all *Hudson Bells*. In fact he's playing around with a spirit editor package, and came up with the image

of an owl. It was just one of lots of ideas — I'd like to do something involving skeletons — but it was the best of *Hudson Bell*."

Hudson Bell's history is well documented in the game's manual, written by Steve's brother. In this adventure his mission is to rescue his beloved Glenda from the clutches of the GL-Guards. In the first screen he had to investigate a mine, searching traps and avoiding the mine. In the second there are hidden levers which must be pulled up in order to open the door to the next level, and a man of hidden items which restores Bell's strength. The third screen is a speed which Bell must increase by knocking holes in the wall with his head, so that he can take refuge from the marauding rats. Should he restore Glenda, there's a choice of various various options which ends with the unfortunate girl being kidnapped again, and the whole thing restarts. *Hudson Bell*, born of the game Steve has written for the growth's owner of Commodore (Horizon), may return to Steve's next game, but for the moment let's leave him to the rats.

Steve's latest production is *Falcon Patrol 2*. "We thought for a long time about how we could do a sequel. I designed the track, ground, which was substantially the same as the original, but with more detail. Then one of the other programmers on Virgin's team looked at it and enlarged the size of some of the buildings, and added the pyramids — it now looks quite different to my original design. I now have things like the lava river and the high-rise areas worked out, so there wasn't much effort required on that side of things. My brother Dave wrote the music. We use a

TEAC Portastudio and a King Maids Poly to work out the music, then I can Synthesizer and a cassette. I've written myself in charge the music this into my program. One thing you'll get in my about the 64 is that the sounds are better than the graphics,

although the filter on the S&S chip can be a bit variable."

A lot of work on *Falcon Patrol 2* went into the sprites. "I didn't use the map mode because it used up a lot of memory. The

background is all user-defined graphics, and the helicopters and fix are sprites. You'll notice that the fix markers sometimes stop firing when the helicopter moves — this is because I've stolen the sprites. Guess the *Star Wars* of the Midwest Canada use only eight sprites, though it looks like there are more. I experimented with sprites to control more sprites — you could have 128 going steady, but due to the interrupt structure they could only move horizontally. This would be all right for a game like *Frigger*, but not much good in something like *Falcon Patrol*.

"I tried to write a routine which would use 16 sprites, using just the standard eight by turning them on and off with the interrupts. It didn't work out because the results were too flickery. On the Spectrum you can define any number of "sprites" you like, but the problem with the machine is the colour display.

"Another idea I experimented with on FPS was to hit on the ground, but the sprite representation with the sprite processor made it all too complicated. I'd rather take a few ideas in their hand than try to create a too many, so I just used the ground-based fix markers and radar jammer.

"The games for FPS are quite different to those in FPS, you can't just come up on the enemy from behind. The helicopters move more randomly in fact there are 12 variations between levels — some of them are quite subtle, others more obvious, like the height at which the fix markers can be fired. As levels 8 and 9 there's a lot more fix — you can just about ignore it in the early levels.

"I'm not much of a games player — the highest score I've got on FPS is 4300. I'm just not interested I suppose.

"My brother Robert designed the aircraft in FPS, and the way it looks and turns. Since I don't see many other games it's a great help to have the opinions of my brothers and the other Virgin programmers — they are and play everything going. I like a few games — I bought a Spectrum just to

play *Fighter Pilot*, and I like *Interstellar* (better and some of Jeff Minter's games on the 64. But I couldn't write something like Virgin's Spectrum game *Strangeloop* — it just wouldn't hold my interest when other games. I've got lots of ideas, though, that might be suitable for one of the Virgin 600 printers — something about helicopters trying to keep the logs from blocking the stream, or another idea I had was a game where you're just like a flight simulator only with a fiction and broken and so on."

Though there's more the new Commodore machines, he doesn't regard them as games playing machines. "I use the 64 for some business applications, Paperclip helps me in the word processing, and some accounts and spreadsheet work. The Plus/4 might do a good applications machine, but Commodore might do better off dropping the price of the 64. They'll certainly have to consider doing that in the case of the C16, it's to compare with the Spectrum. The 64 would be just right if the price was a little lower, and if it had better colour cards. You I think ideas like speech synthesis hardware are basically good, but they need a year here before the software houses will take it up. Some software is good in principle, but you need around 10,000 programs for reasonably cost-effective results — the memory just isn't there.

"I wouldn't break into a game to look at how it's written — firstly there aren't that many I've interested in, secondly I don't like the idea. I think it's the originality of the concept that makes all the difference. That's why my own game is going to be really unusual — no typing, no simple single quest, the aim isn't even just to survive games. There are going to be seven or eight characters, one of which the player will control. There's an interactive element, with the other characters trying to stop or help you as you do the job you've set out to do. I think I'll be able to use 40 or 50 sprites with a reasonable amount of detail, using some characters repeatedly in different combinations. The main feature is going to be the graphics effects, with music and dialogue like in a film. I don't know what you'll call it — it's neither an arcade game nor an adventure — it's probably not even a game at all!

"I work when the mood takes me, sometimes for up to 12 hours at a time. It doesn't feel like working. I get overwhelmed by push eventually and I get back down to it, but it's not good trying to force an idea — some

thing always turns up if I give it long enough.

"Machines will might be the base of the new game, or maybe not — we'll have to see how it goes. Working with the Virgin team there are always new ideas coming from all directions." ■

If Santa brought you a Commodore 64 or a Vic 20, you might find yourself sitting in front of your TV watching the cursor flashing, with no idea what to do next. Sarah Corbett explains the basics of Basic, and sets you on the road to programming success.

SUCCESS

If YOU are baffled by your Vic 20 or Commodore 64 then this article should be of some assistance. It covers essential basic principles of using your computer in an easy to understand way.

When you turn on your computer you will see a blinking square on the screen. This is the **CURSOR**, which tells you where the next letter will be printed. You can move it about the screen using the keys in the bottom right-hand corner of the keyboard marked **CBSR**. The left-hand one will make the cursor move directly downwards, but if it is used in conjunction with one of the shift keys the cursor moves up. The right-hand key controls horizontal movement and again can be used with the shift key.

You can easily change the colour of the cursor. If you type in a few letters you can tell that they appear in the same colour as the cursor. To change colour hold down the **CTRL** key along with one of the colour keys. You will notice that the first three letters of the colour are chosen on the vertical column of the keys, **BLK**=black, **PUR**=purple, **WHI**=white, **GRN**=green, **RED**=red, **BLU**=blue, **CYN**=cyan (light blue), **YEL**=yellow.

The Commodore 64 also has 8 additional colours, which can be accessed using the Commodore logo key in the bottom left-hand corner instead of **CTRL**.

Lines

As well as changing the cursor, you can also alter the colour of the screen and border. For the Vic-20 type the following and then hit the **RETURN** key.

```
POKE 16475,0      Then will give you a
completely black screen. Other combinations
can be found on page 124 of the
supplied manual. On the Commodore 64
you will need to type two lines, each
followed by the RETURN key. Firstly type
```

```
POKE 12380,0
```

This will give you a black border. Now try this

```
POKE 12381,0
```

The numbers of the other colours are on page 84 of the user guide.

For both computers you can get back to the original colour by holding down the **SHIFT/STOP** and **SHIFT/END** keys together.

Try typing in words and graphics until the screen is full. On the vertical faces of most of the keys you will see the "PET graphic characters". To obtain these on the left, use the Commodore logo key, and for those on the right simply use one of the shift keys. If the screen gets a bit cluttered up hold down the **CLS/HOME** key and shift simultaneously. Without the shift key this will return the cursor to the top left hand corner.

Make sure that you know where the **RETURN** key is, as you will be using it a lot on the future. It is employed to enter instructions or information.

To get your computer to work you will need to write a "PROGRAM" which is really just a set of instructions. The

Program 1

```
10 PRINT HELLO
20 GOTO 10
```

Program 2

```
10 PRINT HELLO
20 PRINT 12
30 PRINT 12*3
40 PRINT 12/3
50 PRINT 3*3
60 PRINT 3+3
70 PRINT 3-3
80 PRINT 12/3
90 PRINT 12/3
100 PRINT SWORD + "FISH"
110 PRINT SWORD + "FISH"
120 PRINT BAY , NIGHT
130 PRINT 3+3
```

4. program is divided into lines, each with its own numbered number. When the computer is asked to start the program working it begins at the line with the lowest number and then systematically follows through. Type in program one, remembering to hit RETURN after each line. The quotation marks (") can be obtained using the keys "shift" and "1". If you make any mistakes then you can use the INST/DEL key to erase any previous characters.

Nothing will actually happen yet — the computer has just stored up the program in its memory. You can check this by typing LIST followed by the RETURN key. This will display the program lines in numerical order regardless of the order they were typed in. When you are ready to get the program working type RUN, but don't forget the RETURN key. If you have any difficulties with the program not working check that it is absolutely correct. Any lines which are not right can be re-typed. When you get fed up press the RUN/STOP key.

Comments

Now let us see how the program was constructed. The lines are numbered 10 and 20 so that there are plenty of gaps in between to add more commands. For example, we would add another line labelled 15 or 17 (it doesn't matter how the lines are numbered, so long as the line numbers correspond to the order the program is to be worked).

Line 10 prints an X displays on the screen the letters within the quotation marks. You could change the word "HELLO" to anything else by overtyping the line. Try this and use LIST to check that the computer has noted your alterations. Adding a tabulation (t) after the final quotation mark will produce an interesting effect.

Line 20 tells the computer to go back to line 10 and begin again.

You can erase any line by typing the appropriate line number followed by the RETURN key. Try removing line 20 in our sample program.

If you want to get rid of an entire program use the command "NEW" followed by the RETURN key. This should always be used with care — once your program has been stored it cannot be retrieved. Always remember to use the "NEW" command before entering any program from this article to erase any previous program.

Try program one. Remember to use NEW, the RETURN key and RUN to get everything working properly.

Compare the results obtained to the program itself and you will see the different ways in which the print statement works. Take note of the different mathematical functions in table 1.

You have already seen how to move the cursor and change its colour. Now let us have a look at how to store a program. Store the word "HELLO" in block 3 space, then the cursor and 9 space on. Start by typing program 1.

After the quotation mark press CTRL and 1. You will see 1 little square appear

Program 1

on the screen which is called a "visual character". It tells the computer to change the output within the program and also directly as we have done before. Follow this with 3 presses of the cursor down key, 3 presses of the cursor right key, the word "HELLO" and finally a question mark. We RETURN and RUN the program.

Variables can be thought of as little boxes within your computer which can hold information. The box is given a name so it can be referred to later. For the moment you will be working 3 types, firstly variables with names consisting of 1 letter, 2 letters or a letter and a number, for example A, TT, T1. Each of these "boxes" can only hold one number. If we want to put the number 4 in a variable called T this is what we type (see program 4).

Try this short program out. Now let's add 4 to the variable, as shown in program 5.

4...Then

You will notice that when the print command is used in conjunction with a variable no quotation marks are required. The way we have laid out this short program also illustrates the importance of leaving plenty of gaps between the line numbers.

The second type of variable such as AB, AAB, A1B consists of letters or letters and numbers followed by a dollar sign. These can hold strings/groups of letters and numbers but the numbers cannot directly be used in mathematical calculations. Try program 7. You should be familiar with all the commands included.

Up till now we have been using the LET statement to put something into a variable, but it is not really necessary. Thus we could change line 10 in our last program to that in program 8.

Before we see another program using variables let's learn a little about IF THEN statements. They can be used in conjunction with variables to set up conditions within programs in the form of "IF something happens THEN do something else". Refer to table 2.

Now let's try program 9. When it is run 1 HELLO's will be printed on the screen. T is the name given to the variable which means that it can only hold a number.

4a...Next

Line 10 makes sure that T is set at 0 and each time HELLO is printed the number held in the box is increased by 1. Line 40 checks to see if T is greater than 2 and if it is it automatically stops the program. Otherwise it continues to line 30.

In the last program we were able to control the number of times an operation was completed. Although the program worked well there is a faster and cleaner way of achieving at the same result. Try program 10 which employs a FOR NEXT loop.

This time you only need 3 short lines. I have chosen the variable T again so that you can easily compare this program with our last one.

The computer begins at line 10, setting T at 1. HELLO is printed and the

Program 10

10 FOR T=1 TO 3

Or play safe and choose somewhere in between

At each level you're able to play either a friend or the computer

But be warned, it plays a pretty mean game does the Commodore 64!

You can also choose your team's colours, and those of the opposing team

Which is great

It means you can play for Chelsea one day, and QPR the next. Or Celtic, then Rangers

Imagine that

Or you can play in your own team's colours against Liverpool and thrash them

With International Football you get all the atmosphere of

THEIR FEET IN YOUR HANDS.

OK, so you like to think you can play football like Pele

Well, now's your chance to prove it

With the best football game that's ever been seen outside of Wimbledon

Not only is International Football startlingly life-like, but it gives you near perfect control over the players

The ball's at their feet, and their feet are in your hands

You can kick the ball and you can dribble it. You can pass it or even head it

And every time you belt

the ball into the net, the crowd cheers madly

How often you score depends on how good you are. It also depends on the level at which you choose to play

Altogether there are seven levels. From good amateur to well, good professional

You can choose the easiest level of play, so long as you don't expect a walk-over

Or, if you fancy seeing what it's like to play in a Cup Final, then you can always choose the most difficult level

a Cup Final spectacular in your own front room

The game is a real test of skill, dexterity and speed, and guaranteed to very quickly drive you football crazy

Like all of our software, International Football has been designed to make the very most of our hardware

Commodore software. It costs no more, even though there's more to it

■ So you're hardly stumped for choice.

■ You simply choose your colours and characters, then 'build up' your picture. Just like any other artist.

■ With 'Art Master' you again get a choice of 121 colour shades.

■ But this time you can draw whatever shapes you like, creating your very own high resolution masterpiece from a blank screen.

■ It is even possible to draw circles, and store and then recall a back up picture - which is more than you can do with other graphics programs.

■ Everyone, from the six

PICTURE YOURSELF ON T.V.

■ We're not the only people who think 'Art Master' and 'Picture Builder' are two quite exceptional computer-graphics software programs.

■ Tony and Rolf do, too. Otherwise they'd never have agreed to put their name to them.

■ With both 'Art Master' and 'Picture Builder' you can create full colour pictures on your own TV screen.

■ And believe us when we say those pictures will match

the best computer graphics you have ever seen.

■ Anywhere.

■ The pictures are drawn using either the keyboard or a joystick, and can be stored on other tape or on disk.

■ With 'Picture Builder' you are presented with a palette of 121 colour shades (more than enough for any budding Michaelangelo).

■ And a collection of character sets totalling over 250 shapes.

4) object appears infinitely large because it is so close. A Z value of zero is taken to mean the surface of the screen itself. Hence if you draw a rectangle with co-ordinates at (-100, -100, 0), (-100, 100, 0), (100, 100, 0) and (100, -100, 0) then it will probably fill the screen. Luckily, as the equation Z value increases faster by 100, 100, 100, 100, the object will become smaller and appears to recede from view. Drawing a cube at a distance of 10000 units will produce no more than a point.

Now, all we need to do is to derive a formula for correcting co-ordinates depending on their distance. It is surprisingly easy to produce an approximate formula with sufficient accuracy for our purposes. Assuming that the size is dependent on the Z value, we find that a co-ordinate with its partner (X, Y, Z) has an apparent screen position of:

$$100 \sqrt{(10000/Z)^2 + 1} \approx 10000/100 + (Z/10)$$

A closer look at the formula shows several clues. Firstly, we have converted a 3-dimensional point (X, Y, Z) into a 2-dimensional point (X', Y') for the TV screen. Secondly, the conversion is achieved simply by multiplying by a factor dependent on Z, namely $10000/(100 + Z)$. When Z is -200, the expansion evaluates as 500/1 which means all points are magnified 500 times, because they are so close. When Z is zero, the expansion gives $10000/100 = 1$, and hence all points appear normal size. Finally,

as Z increases to 10001 + 300, the evaluation gives $1000/100 = 0.1$, so all points are half size, and so on.

This simple procedure is the one used to scale the co-ordinates in the program and, owing to its frequent use, is defined in a BASIC function in line 1200. The actual statement for drawing a 3-D line using 3-D line is in line 1240. Note that the addition of +10000 to Z is to avoid the danger that the normal screen is 10000 ± 200 , and so the centre of the screen is at 100 100.

We now have the ability to describe any line in 3-D. By making the two end points of the line to be the same, we can plot a single point. All we need now is something to draw. This is provided by the accompanying program as it draws a cube moving through space.

Two forms of motion are incorporated. The first is that the cube is moving away from you. This movement is controlled by line 1000 which sets up the value LOC which ranges from -30 to 300, and is the Z value of the centre of the cube and hence 1000 and 1000. As LOC increases, the cube is supposed to move away. This is done in the latter two lines by adding LOC to the normal value of the Z value of each corner.

The second form of motion is that the cube is rotating around one of its axes. Secondly, the corners of the cube are rotated around the axis. This program is listed will make the cube appear to rotate in a clock-

wise direction, with the actual change in angle given by line 1240. If you change ANG to the line negative, the cube will rotate in the opposite direction. Similarly, if ANG is set to zero, the cube will not rotate at all. You may like to observe how the cube appears if it rotates around other axes. Try replacing line 1240-1250 (rotating) with either of the following alternatives:

```
1240 T=PI/4*Z/10
1245 P1=LOC/10-INT(P1/LOC/10)*LOC/10
ANG1=P1*PI/4*Z/10000*ANG+0.1
1250 P2=LOC/10-INT(P2/LOC/10)*LOC/10
1255 P3=LOC/10-INT(P3/LOC/10)*LOC/10
1260 T=PI/4*Z/10
1265 P1=LOC/10-INT(P1/LOC/10)*LOC/10
ANG1=P1*PI/4*Z/10000*ANG+0.1
1270 P2=LOC/10-INT(P2/LOC/10)*LOC/10
1275 P3=LOC/10-INT(P3/LOC/10)*LOC/10
```

Each of these alternatives will produce a different type of rotation. For extra effect, try combining two rotations. First perform one rotation, then perform the next, and so on. ()

Hopefully, you should now have enough material to try a few experiments for your self. Even if you do not understand all of the theory, you can see that 3-D effects can be achieved fairly quickly. If you try altering small sections of the program — concentrating on the lines mentioned in the text — you will see what effect they have on the display as a program. ■

CLIFF HANGER

AUTHOR - JAMES DAY ORIGINAL MUSIC - BRIAN DOE

Tired of the cartoon style action of Cliff Hanger, a really original, Wild West game. As Cliff the hero, you've got to stop the bandits shaking up the canyon. But with its own brand of wacky cartoon action fun, things simply aren't as they seem in Cliff Hanger. For a start, the boulder you throw at the ol' bandits may just come bouncing back at you.

Cliff Hanger incorporates all the elements that have made New Generation games best sellers for the Spectrum, such as original ideas, superb graphics and hilarious happenings - but now it's available first for the Commodore 64.

Featuring 30 separate screens, three levels of difficulty, one- or two-players scoring, Hall of fame and joystick compatibility or user defined keys, Cliff Hanger is set to be **THE** Commodore games playing sensation. Available from any good software store for just £7.95.

Shoot the Rapids

AUTHOR - PAUL BLAIN

Ever wondered what it would be like to face the fierce white water in a top class current slalom run? Well wonder no more because you can enjoy the fast action thrill of competitive canoeing from the comfort of your own armchair with Shoot the Rapids.

It's a game that involves real skill because you must move your paddock to simulate paddling action. You must get through the gates of the slalom course in the fastest time possible, while avoiding the river bank and rocks. There are also extra hazards like rogue speed boats and interfering boaters to worry about.

This multi level game features increasingly difficult river courses with superb graphics and smooth scrolling along the river. Qualifying times have to be reached to move onto the next course.

With Hall of Fame, one or two player scoring and joystick compatibility, Shoot the Rapids is probably the best sports action simulation game devised to date. Available from any good software store for just £7.95.

I am the music man, I come from down your way

David Fox takes a trip down melody lane with a review of MusiCalc

HEARING mentioned MusiCalc in previous articles on Commodore 64 music, it seems appropriate to take a closer look now, since the demonstration seems well established and additions to the original range are on the way.

The 64's power ful SED (Sound Interface Device) chip gives it the capability of making music comparable to many dedicated music synthesizers, and since there are three sound channels you can also play chords. The 64's huge memory also means that it has the capability to store huge amounts of note information as DMTA instructions.

The big problem is in accessing all this power through Basic, since most separate POKE's are needed to fully set a sound register, it's a formidable task to get terms a long way off the 64. It's much easier to forget Basic and go for one of the many sound synthesis packages now available, of which the most powerful is MusiCalc.

MusiCalc is disk-based only, and is intended to be an on-demand suite of programs which can be revised, updated and expanded by future packages. Moreover, there are also plans to incorporate hardware and interface dedicated musical instruments.

MusiCalc comes from Warfield of

California, and so far copies of three main programs plus two "templates", the function of which will become clear.

MusiCalc 1, Synthesizer and Sequencer, runs DAI. On loading you are presented with a screen display showing all the available sound parameters. Using a system of bar graphs and keys, all the parameters — waveform, ADSR, frequency, stereo, and so on — can be individually controlled for the three voices.

Synchronised score

On the right of the display is a colourful grid with moving squares which synchronises with the music currently playing.

On loading there are actually 32 score patterns as preset files. These range from rock to classical, Latin American, new-wave and so on. Scores are selected from the keyboard, as are the 32 "sound sets" — combinations of different voice settings. In other words there are 1024 combinations of voice and sound available on loading, which can be altered as you wish, cut down to basic lines for use as backing themes, or revised and replaced entirely.

The template disks mentioned earlier contain more of these demo files. The first selections being Rock and Latin American.

Needless to say the American idea of Rock and Latin American is pretty laughable, but at least the demos are a good base to work on.

MusiCalc 1 has its major abilities, which we'll look at in turn. The first is sound synthesis, which is carried out in eight bar words with keys used as toggle switches or continuous.

Secondly, composition is carried out on the Score Screen in which an enlarged version of the synthesised line on the main screen represents the note positions for each of the three voices throughout the composition. Notes are written using the cursor to place blocks on the grid, specifying notes and pitch for each one and adjusting tempo accordingly.

The third function is playing from the keyboard. It's impossible to overcome the inherent difficulties in playing on the monitor, but the addition of a mechanical music keyboard is a handy possibility. The MusiCalc 1 package, Keyboard Mixer (which can only be used in conjunction with MusiCalc 1) can be used to define any keyboard parameters, and to set unconventional notes — good for Synthesizer fans.

The fourth function of the MusiCalc 1 package is to select demo scores or load templates. There is provision to inform you in the main screen on how to go about this, and I would hope that this task would be covered before MusiCalc has the stage.

"There are 1024 com- binations"

The fifth function is the mixing of sound/voice sets in a block disk, which means of course that your symphony can be recalled for performance or modification at any time.

The last function, and possibly the most exciting one, is the ability to call on other programs to work with MusiCalc 1.

Again there is an incredible lack of detail on the manuals with which I was provided.

The **MiniCalc 2** package, for instance, has the ability to print out manual scores (given a suitable printer), and allows **MiniCalc** to be synchronised with drum machines such as the ubiquitous Roland TR-808 Drummer. But how! There are also basic effects units such as digital delays can be used as **MiniCalc 2** costs £20, as does **MiniCalc 3**.

The templates are £15 each, and the new one in the series is **The Beat File**, a set of drum rhythms ranging from rock to swing.

So **MiniCalc** is an incredibly powerful system, totally open-ended and capable of allowing composition, music writing and sound synthesis with no necessity for

manual training or expensive dedicated equipment.

The main problem at the moment seems to be with the manuals, which are very full and detailed in some places but seem to miss out on some other things. Let's hope the situation is rectified.

Limitless future

The future of **MiniCalc** is virtually limitless. Although the one American keyboard is on show at the PMA, (yes, natural Commodore Share is here) are unlikely to be imported due to prohibitive shipping costs, **MiniCalc UK** hopes to produce a keyboard for around £80

There's no indication yet whether this will be a full mechanical type or a touch-type.

Other projects include a cartridge version of **MiniCalc 1**, more templates, and, most importantly, a MIDI interface.

As explained in previous articles, MIDI is a standard which has been adopted by all the major synthesiser manufacturers, allowing synths, drum machines and sequencers to exchange notes and patch information. There are already interfaces and software available from SEEL, Imperial Connect and Sanyo, allowing the lot to control MIDI-based equipment, and the prospect for a MIDI version of **MiniCalc** are very exciting. Plans are also afoot to allow raw MIDI to be controlled together, personally controlled by a mechanical keyboard or MIDI synth, allowing an even computer polyphony.

As the moment **MiniCalc** is available and order from **MiniCalc UK**, The Paradise Centre, The Metropolitan, Bedford Road, London NE1, 01 241 1440. Retail outlets are being developed, although **MiniCalc UK** feels that a shop environment is perhaps not the best place to get the full of the system's possibilities. Admittedly the **MiniCalc** suite is so powerful that a month later heart to get a full demo — but even the briefest look will I think win you over. Electronic Soundscapes & Computer Music, a monthly magazine available from all good newsagents, will be carrying an write-ups including a **MiniCalc** demo in a forthcoming issue. Watch out for it — **MiniCalc** is well worth hearing. ■

For work or play Voltmace has the answer!

For play The delta 3sc joystick is intended for the more sophisticated user. A lightweight unit designed to be held and operated by the fingertips of the other hand. The rotary attack switches cannot be damaged by excess pressure on the joystick (and the fire buttons) choice of three, have been tested for millions of operations.

For work The datapad 16c—a sixteen key full-sized keypad for the IBM PC. Simply plug into the two control ports. Complete with a cassette program to define the key of choice. In operation just push on the "shift lock" to select keypad.

ADSR's filters, waveforms and resonance — David Fox discovers how easy it is to bash out a tune with Commodore's budget performance package, the remarkable Music Maker

REASONING AT a remarkably late date that many 64 users want to do more with their machines than squish charts, Commodore has—in conjunction with the UK's biggest music publisher, Music Sales, come up with the Music Maker system.

It allows you to use your 64 as a musical instrument, without the disadvantages of typing in tone information through the CIPHERITY keyboard, as you must with most of the available music composition software packages (see *Commodore Horizons* May issue). At the same time you don't have to spend money on a full-size mechanical music keyboard, such as the £295 Eke 1 or the £325 Acoustaphonic Microsound II.

The Music Maker is cheap, easy to use and fun, and should sell as well as expected, especially if a price near the chips or large quantities is later for Christmas. Basically, it uses the facilities of the 64's Super Interface Device — the SID chip — to turn the 64 into a musical instrument, compatible in use of the cheaper Eke1 home keyboard.

Keyboard

The main feature of the Music Maker system is the chip-on mechanical keyboard which sits over the top rows of the 64 and mechanically depresses the CIPHERITY keys when pressed. Also included in the package is a set of stickers, which inexperienced musicians can use to set key ideas faster, a music book, one of the 25K songs from Music Sales, and software on disk or tape.

The software, developed by Richard Watt of Milton Keynes Music, uses the 64 many of the capabilities of the extremely popular Cante VLT/Verse. In the same manner, the function keys can be used to control rhythm notes, which gives a choice of four backing rhythms (drums, snare, bass line, poly play), which gives three-note chords, and voice melody, which allows most of the facilities of the SID chip to be used to define new sounds.

There is a useful performance feature, similar to real synthesizers, by which the pitch of the note played can be bent by pressing on the squelcher. Unfortunately it doesn't seem to work in poly mode, or

allow downwards pitchbend.

In Voice Modally mode, the four envelope parameters can be changed with simple use of the function keys: Attack, Decay, Sustain and Release — the screen menu describes the "sound shape" of a voice, the way it builds up, holds at a certain level, then fades out again — can be set from 0 to 12. Waveform waveform, triangle, pulse or square can then be set — these control the sound quality, whether it's sine, dull, low, or in the case of some, strictly a wide band sound.

Pulse width can then be selected in the case of the pulse waveform, which gives further control over the sound quality. Filtering — the selection of low or high frequencies to be filtered or removed from the sound — is then selected, as a resonance, the "harmonic" or power of the filter.

Popular

Having set your desired sound you can enter a tune with one finger, screen an overview to the timing of the notes. The 25K music books give many examples of popular tunes, but definitions of "popular" are subjective. Eric Preedy's *Wooden Heart* may be some people's idea of music, but not so Klaus Schulze's *Reverend Bizarre* are some.

Having entered the notes you can enter

the timing by tapping any key on the control rhythm. The complete tune can then be played back at perfect timing.

Voice or notes can be saved to tape or disk and extended at any time, and there are three demonstration tunes included in the software, George, Isaac Watts, and, possibly, *White F* or *4*.

It's very easy to see that there's a tuning facility included in the software: you can tune the 64 to a piano, guitar or any synthesizer. The screen could then be used as a primitive sequencer or drum machine, or as a lead or polylead in a path.

The handbook gives some useful suggestions for sound settings, and incorporates guidance on adapting your 64's sound to a hi-fi system, an excellent idea if you mean to use the system at all seriously.

Through the Music Maker system is fun as well, there are a couple of reservations. The two-octave keyboard means a little fatigue, though production models will apparently be more robust. There's also no provision for modulation of sounds, though a future software package. Presumably should make all the capabilities of the SID chip available including modulation, sync, triggered and so on.

Hardware

Other packages planned include a composition program which will enable musical notes to be placed on a graphic representation of a music staff. This package should also allow compositions to be printed out, in the same way that *Waveform's* *MusicCalc* 2 package does.

In fact the Music Maker system should eventually resemble *Waveform's* more expensive *MusicCalc* suite of programs. With the initial Music Maker package costing only £29.95, it seems certain that many budding computer musicians will find this the ideal introduction to the subject — and with resampling hints of better Commodore music hardware, perhaps even a HIGH machine which will allow professional-standard synthesizers to be connected to the 64, Commodore holds out the promise of a happy future for musical 64 owners. ■

How to teach your Micro a thing or two

Thousands of home computer owners have yet to discover their microcomputer's potential to help with many of the problems and decisions that come up every day in the home or office.

Perhaps you have always promised yourself that you would teach yourself programming, but have been put off by manuals which seem to assume a lifetime spent studying computer science and mathematics. Maybe you have looked at other computer books, but have yet to find one which is free of unnecessary jargon or where the program examples bear some relevance to real life and not space invaders.

Relax, your search is over.

The 'Learn BASIC' manuals from Logic 3 are the latest development of a teaching method pioneered by Professor Andrew Colin and perfected

by testing on 3 generations of students at Strathclyde University. The 'Strathclyde Method' has been translated into 8 languages and used by over 100,000 microcomputer users.

'Learn BASIC' is a jargon free, step by step, course in computer programming, which explains everything clearly in English, not computer talk. In a matter of hours you will be writing your first program.

'Learn BASIC' is designed for people who want to keep abreast of the computer age, for people who realise that understanding computers is a key to future success at work, at school, and as a parent.

Get 'Learn BASIC' and teach your micro how to be useful! (Available from major branches of W H Smith, Books, Lads, Girls, John Menzies and major computer shops nationwide.)

Flight Simulator II takes to the air

That daring young man in his flying machine Pete Gerrard finds that taking off is a great deal easier than landing

THERE ARE flight simulators, and there are flight simulations, and so far most of the material that has been produced has involved little more than pressing a few buttons, leaving a few engine noises and seeing a couple of digits flick on the screen. A real pilot would be very dismayed by the quality of most flight simulator software currently available.

Apart, that is, from the one *Flight Simulator II* is a painstaking tour de force, and everything about the package smacks of a loving care and attention to detail included in the package is non-existent, one program named, and one far too general concerning itself with flight physics and aircraft control as it applies both to the program and to flying generally. It is only available on disk, due to the complexity of the more of programs on a later program and various displays are continuously called up from disk, and the random access that this provides enables it to be so differentiating. You can play, if that's the right word for a program of this standard, using a combination of keyboard and one or two joysticks, although you can opt for using the keyboard alone if you wish.

Further documentation supplied is impressive. There is a flight reference card, telling you what all the main controls do, along with four maps of various airport areas. These cover the Chicago, Seattle, Los Angeles, and New York and Boston areas, listing all the major airports in the vicinity. Finally, the amount of detail that has gone into putting this whole package together is highly commendable.

The only thing that was found to be at fault is a few simulators was an accompanying note, detailing some of the features mentioned in the comprehensive manual that do not, in fact, exist. Since everything else is covered down to the last detail, it seems a shame that such a factor as the effect of wind turbulence has been omitted. However, this is but a minor criticism.

Off the ground

To get off the ground and get the program running requires a good few minutes, during which time you see some really strange displays on screen as various high resolution displays are called up and discarded in favour of others. Throughout the game, the border

continually changes colour whenever any new files are called up, a neat touch, so let you know that the computer's still doing something.

The plane that you are about to pilot is a Piper PA-28-181 Archer II, which is a single engine plane, top speed of around 150 miles per hour, with non-extendable gear and equipped with a good set of controls. Apparently, this particular plane was chosen because it has a good performance, but is relatively easy to fly.

Once the usual five files have loaded, you are asked whether you are using a colour or black and white monitor (colour displays are tapered according to which is in operation), and then what bit you wish to go into (either flight mode or test flight). Either way you are into the program proper, and can start to actually do a few things with the plane.

You start off at Meigs Field airport in Chicago, a small airport surrounded by Lake Michigan. The instrument display is basically split up into two sections, the bottom half displaying the control panel, while the top half is reserved for a solid, colour (if the appropriate option is chosen) three dimensional display of what you're

using out of the front of the craft. This display can be altered to give you a view 90 degrees to the left or right, and also a view of what's going on behind you.

Also, at this point in the game before we actually get off the ground, many other parameters and options can be chosen and altered, by entering what is referred to as the editor. Here, such factors as environment, wind speed, steering system, difficulty of flight (whether you have a leisurely plane, or a more realistic one), mission, and so on, can all be readily altered.

There is a further (very large) subprogram within the main set, which runs the program from being a flight simulator into a World War I fighting game, but none of that later. For now, let's get off the ground.

For now, you really do get the feeling that you are actually sitting in a plane on a runway, taxiing towards takeoff. As the throttle is opened up and you raise the elevator a little, the sound that you hear changes accordingly, the view from the front of the aircraft gradually changes also, and the control panel at front of you flickers into life.

After a few seconds, that magical moment arrives when you become airborne, and you rapidly realize that you haven't read the manual properly and don't know what on earth (or rather, off) you're doing. This is quite an alarming feeling, because the package is so realistic. Once in the air, the control panel shows speed, altitude, artificial horizon, etc. indicator and such co-ordinates.

Altering the rudder, ailerons, elevator and flaps now produces a realistic and

with a tail-whiffed, over the machine guns up the single word "Yeehh?" to indicate that you've had it. No problems here, can't be said life, as you simply start off again.

After a few more experiments which usually result in wonder, disaster, you slowly begin to get the hang of the thing, and attempt some longer but more serious flight in another airport. Not being too adventurous at first, I selected nearby Vermilion County, which seemed like a fairly straightforward flight. Before taking off, you are well advised to consult the map for information on the place you're going to try and get to, since this gives you a wealth of useful information about it, including (of course) where it is in relation to you, in terms of co-ordinates and altitude.

Unsuccessful flights

After a few unsuccessful flights like this, as landing is about the most difficult part of flying (well, landing successfully at other in real life or using such a realistic simulator as this, you can get more damage and attempt longer flights. The program, after all, is supposed to cope with the whole world, and although you've only got two fuel tanks on board you can obviously land and re-fuel en route to your destination. Landing at some of the more famous airports produces some startling three dimensional displays (the house of Liberty), and throughout I was just so impressed, and so convinced, about the whole thing.

The World War I fighting version mentioned earlier is probably the most successful when played for a while, and

because a screen at the controls is now going to stand much closer to open warfare. Here we have the familiar three dimensional view out of the front window, but one or two things have changed. Your radar will show other enemy planes approaching, and gives some indication of their relative position and altitude. The plane is now equipped with machine guns, and the sights in the center of the round display reveal what you're aiming at at the time. In my case, usually a mouse or two, but I did manage one or two enemy.

Your mission here is to destroy the enemy, and return to base. On one side of a river lies the enemy, on the other side you have your own base, and it's a good idea to have a rest before starting again, as this gives you the chance of finding out what's wrong.

There is so much that one could say about a set of programs as good as this, that it would take an entire magazine to do justice to it. Professional pilots have said that they reckon it to be about the best simulator they've ever seen, and although I've never flown a plane in my life (and never will after the disaster encountered while trying to get the hang of that), I would have to agree. The review copy was supplied by the M Supplies Company of PO Box 19, Whitstable, Kent, which markets Flight Simulator II at £39.

Everything that a pilot would expect to find in its home surroundings, and anybody who has been disillusioned about their simulator in the past should try this. If you want something different, and don't mind spending a two week holiday flying planes in the luxury of your front room,

The tough nuts to crack!

Braingames bring you the most entertaining and fulfilling adventure and strategy games.

Our adventures combine strong story lines, high quality graphics and sound to produce games you will want to play time after time.

Strategy games ranging from the White House to King Arthur's Court, from the oil business to a used car lot, will test your skills and imagination.

FAME QUEST

A friendly joust or duel to the death? Kill the dragon, run away or even try to talk to it?

These are some of the questions you will have to answer on your Fame Quest. You enter this world as a lowly knight without sword or armour. By means of your skill and judgement you will accumulate fame (and money!). Given time you may expect to be the rightmost warrior in the land, but beware — many encounters await you on your Quest.

Commodore's Christmas presents

AS A Christmas bonus, Commodore UK is offering a Plus/4 and a C16 as prizes in this special competition.

You'll all have read the reviews of Commodore's two fabulous new home computers. The Plus/4, with its feature software and compatibility with a wide range of Commodore peripherals, is the ideal home applications machine — and

the C16, with its spectacular graphics and easy programming language, is the best introduction to computing, as well as being a powerful games machine.

To win, all you have to do is put in order of merit the various features of the new machines. For instance, if you think the most important feature is "Easy programming", then enter C in box One.

Then fill in the rest of the card in an apt, original manner in fifteen words or less, and post your entry to the competition address. If you do not wish to cut your copy of Commodore Horizons, photocopies or even plain paper copies will be accepted.

Usual competition rules apply. The Editor's judgement is final.

Charting your progress

In the first of a two-part series, David Lawrence shows how to create a variety of charts and graphs

THE C&P is particularly good at displaying information in ways which are more understandable than lists of facts and figures. This article together with next month's presents a series of programs which will create graphs of one kind or another, both in low and high resolution.

The programs are: Graph which creates a very effective and powerful line graph in high resolution; Pictgraph which will take a limited amount of data and display it in the form of a circle split into multi-colour segments and Graph II which allows you to create a stunning 3-D bar chart.

One of the problems of working within 64K of memory is that high resolution programs will always eat into what is available, leaving very little scope for the manipulation of data in applications programs. In the first Graph program, we realise that any routine that functions by creating a program which does not have to devote memory to placing programs in the screen, storing data as arrays or plotting data for storage on to disk or tape. Techniques introduced during the course of the Graph program include the flexible use of DATA statements and the use of logical conditions as variables.

Modules 2.1.1 and 2.1.2 hold the data for the graph. This is the concept of it so that you find it difficult to see the role, value of all the figures. They are not lost because place once you have entered and can be played over over and over, and experienced with making some changes.

Commentary

Lines 1000-1006: These lines contain the name which the user wishes to give the graph as a whole, and the labels to be attached to the vertical and horizontal axes. Note that it is only now the plot area follows the screen as DATA statement is there solely for the convenience of the user and will be ignored by the program — this contains a material to separate the first phrases from the important information which follows it.

Lines 1007-1009: The two axes of the graph will be divided up into units for ease of reading. The user will always be the same length, but the user can specify how many units each will be split up into.

Line 1010: If, for example, the graph was meant to be recording data of what produced by a country over a number of years, the user might wish to make each unit on the vertical axis record a year of

1,000 tons. Rather than make the user divide up the actual figure into units of 1,000 before entering it, the figure in this line allows the units to be specified so that every figure can be entered in full.

Lines 4000-4040: These lines hold the DATA on which the graph will be based. In this example, these figures will produce a smooth, bell shaped curve. Note that there is provision for only one figure for each unit on the horizontal axis, starting at position one, though the whole of the horizontal axis does not have to be used. As many DATA items as desired may be included on each separate line, within the limits of two screen lines for a graph on line.

Lines 6000-6090: These lines allow user data to be entered, though they are not needed in the two graphs presented here. You can use as many data statements as memory will allow, but the information must be terminated by a DATA statement containing the word END. This is the signal to the program that it has reached the end of the DATA to be used for the graph — even if more DATA statements follow.

Module 2.1.3 draws the framework on which the manual graph will be placed, complete with the axes on the axes and the various labels specified.

Commentary

Lines 1020-1026: The two axes are

drawn, a line from near the top left hand corner of the screen to near the bottom left hand corner, containing a right-angle across the bottom of the screen to near the bottom right-hand corner.

Lines 1026: The C&P's data pointer is set to point to the first item of DATA following the start of the module at 4000. The ADDRESS will prevent an OUT OF DATA error being generated if the program is started with GOTO using RUN into the pointer to the first item of DATA anyway.

Lines 1030-1110: The labels for the graph as a whole, the horizontal axis and the vertical axis are read from the DATA statements and printed on the screen. In the case of the label for the vertical axis, a loop is used to print the label character by character down the left hand side of the screen.

Note that in each case there are two READ instructions. The first one picks up the phrase before the comma in the DATA statement. This is then immediately discarded by READING another string into

 UNIT

• The Y or vertical, co-ordinates are slightly more complex. Starting from the bottom of the screen, the value of the DATA item is first divided by LIMIT. Then if the DATA item was 1,000,000 and the user had specified that the vertical axis was to be divided into units of 100,000, (LIMIT = 100,000), then the result would be 1,000,000/100,000 or 10 units. Having arrived at the number of units, this is then multiplied by the height in pixels of the vertical axis (LY). The figure derived is then subtracted from 100 since the screen is numbered from 0 to 100 in the yip.

Line 1100: Each time a single line is drawn on the graph, the end point becomes the start point for the next line. If TIE contains END, however, the following line will continue the extension of the loop.

Timing

RUN the finished program and you should see a smooth, bell shaped curve drawn. When drawing is finished, press any key and you should see the DATA variables load onto the screen so that you can alter them at will.

One very useful way of presenting small amounts of data in the pie chart programme, when a circle is broken up into segments representing the proportions of a total handed over to the different groups which make it up, is the program which follows. We shall show in what we have already learned about the mathematics of circles

Figure 2.2: Pie Chart

(Note the relative equality of the labeling in graphics mode two)

and the flexible use of DATA statements in the last program.

As with the previous high resolution graph, the figures on which the program graph will be based are contained in DATA statements. Also from module 2.2.1. Note, however, that in the program as listed, the two arrays which will be used to hold the names of each item and its value are not

dimensioned, as you are limited to 10 items.

Finally, a pie chart with more than 10 items is of little value, because I became too involved to really take in the information. When so, you can if you wish include a dimensioning statement at the beginning of the program. If you do include such a statement and increase the number of items, you may find that you have to drop some of the module headings, where the program runs right up against the limits of memory.

Module 2.2.2 processes the data for the chart. The information contained in the DATA module is read into the variables NAMES and ITEMS, and the arrays NAMES and A.

Commentary

Lines 5000-5100: The value of the items is to be shared so first added together to discover the total that the circle will represent. The DATA pointer is then RESTORED to the beginning of the queue by ITEMS and each quantity is read into a second figure which, when divided into 360, would give the same result as the original quantity divided into the total. For instance, if the total were 100, and the quantity for one item were 25, this would be translated into 90 (or 22% of 360). These new figures will later be used to determine how large a chunk of the pie chart will be given to each item.

Timing

Enter the following from what was previously in the control module, and then RUN the program.

and continue from
END AND

If all is well, then nothing should happen really — only if there is an error of some kind will you see anything. If you wish, however, you can print out the contents of the variables and arrays shared in the

Module 2.2.3 sets up the graphics mode and unassigned colors, and draws an 80°/80 circle in the center of the screen, together with the same for the chart.

Commentary

Line 2000: The graphics mode we are going to use is multicolor mode, which will allow us to have three different colors other than background color on the screen at the same time. The advantage to this is that it makes the chart easier to read, but the main reason it is possible to have on the screen at any one time, the more complicated it is for the CPU to record the colour of each individual pixel, and the more memory it needs.

Since the graphics screen already takes up enough of the memory, when we go into multicolor mode the operating system does a trade-off between colour and speed. Once it mode there the compiler will be able to actually do anything with will be one pixel down by two pixels across. The screen, as far as the CPU is concerned, will no longer be 128 pixels across but 160, thus saving memory which can be devoted to remembering the greater range of colours.

From now on, therefore, whenever you look at the X co-ordinates (across the screen) of anything in this program, remember that you need to double it before it is comparable with the same co-ordinates in previous high resolution programs in the book which use normal high resolution.

Line 2040: The label expression in the COLOR statement simply ensures that whatever how long the title given in the chart, it should always look as if it has been placed roughly in the middle of the top line.

Line 2000: An illustration of the point made earlier about dimensions in multi-colour mode. To make sense of the parameter and dimensions of this mode, multiply the first and third parameters by two.

Testing

Add the following lines and draw 81°/81 the program:
 REM COLOR 200
 REM CENTER 41
 REM CIRCLE 40

The result should be nothing more exciting than the one given in the chart and a white circle. Press any key except RUN/STOP to get back to the normal screen.

Module 2.2.4 draws in the segments, colours which the chart will be divided, labels them and attaches the labels specified in the DATA module. In order to understand what is going on, you will need to be able to remember the simple mathematics of a circle.

Commentary

Lines 2060-2060: A series of lines are drawn from the centre of the circle to the

circumference, dividing the circle up into the segments for the chart. The angles used are those calculated in Module 2.2.2.

Lines 2060-2100: The angles at which the segments start are calculated again, but five degrees are added to each to draw the lines drawn by the previous loop. A position is then calculated on the basis of the angle which is just inside the circumference of the circle. The PAINT command is then used to colour the wedge shaped segments to which the current point falls.

Line 2090: produces a circle of the three foreground colours specified in Module 2.2.1, except for the last segment, which is left as background colour. This is because it ensures that the final segment, except for the same value as the first. Since they are next to each other this would make the chart harder to read.

Lines 2100-2120: These two lines calculate an angle half way between the start and finish points of the current segment. It is possible that in moving from the start point to the finish point we will cross the 180° boundary on the circle, producing a concave figure — adding 180 rectifies this.

Lines 2120-2150: The figures needed for defining a point in relation to the radius. The reason that the 50° and 50° values are stored in the variables TR and TV on this occasion is that they are going to be used more than once in a line and there would not be room to spell them out in full.

Line 2160: You will recognise the use of a logical condition here. Its effect is to make 100 either zero or 170 according to whether the point defined by TR and TV is to the left or the right of the centre of the circle.

Lines 2170-2260: A line is drawn from the circumference of the circle to the edge of the screen on the left or the right as defined by CC. At the end of the line, or rather over it, is printed the label for the segment to which the line points. The print position for labels on the right hand side is moved to the left so that they do not run off the end of the screen, again using a logical condition.

Testing

Add the following line and RUN the program:
 REM COLOR 200

You should see a display like the one in the beginning of the section for this program, except that it will be in colour rather than plain black and white.

Module 2.2.5 in the control module is

Laser Zap

Send Zapper your blaster away from
yourself for fun

THE AIM of Laser Zap is to destroy the enemy ships and capture flying letters. Let the letters move into your clutches, and avoid the Zappers, which will shoot your ship if you fall in line with it. Break the enemy ship or it will fire burning missiles,

and look out for the ships of your comrades plunging from the sky. More instructions are included in the program. Use a joystick or Port One. Collect all the letters and they spell a message, and the game comes to an end.

Mind Stretchers?

Book: *Commander 64 Mind Stretchers*

Author: Ian Conway
Publisher: Sigma
Cost: £6.25

Reviewed: Daphne Easton

This book contains a mixture of games and advice — some 40 programs in all. There is a sprite editor, a character editor and old favourites like *Mastermind*, *Snakes*, *Life* and *Poker*.

There is nothing particularly wrong with this book, except that it is a few years late. The days when you could put out books of 140 best programs for just — I see long gone. More users are now using more disc-based

games. Given the flood of computer books over the past year, there is surely little scope for titles which do no more than bundle collections of programs together. More inspiration please.

THOMSON COMPUTERS

Beginners guide to the Vic 20

Book: *The Beginner's Guide To The Vic 20*

Author: Peter Smeagol
Publisher: Dorland
Price: £7.95

Reviewed: David Stephenson

If you've struggled with the manual, then this is the book you've been waiting for! This's how the book starts off, and it

indicates what level it is aiming for. But if you have mastered the manual, don't let this put you off considering this book. It is one of the best I have yet seen from Dorland. Like many of their books, it is well presented and prepared, it is very easy to read and easy to follow, even for an absolute beginner. Unfortunately it does have about two printers errors at each of the 12 chapters, but that shouldn't spoil your enjoyment. Also, the author has a refreshing sense of humour which shows that he has enjoyed writing the book.

The book has been set out with plenty of example programs, with lots of handouts for reference, and throughout the book large clear print. It will, as if you've been waiting for a screen for hours, this book shouldn't give you any problems.

Stephens takes you from simple things like how to set up your new computer, use of the screen and keyboard, through to how to make the most of PEEK, POKE and Savings, and also touches on the available peripherals.

The author turned out this is a book for the absolute beginner — well, it is, but it could also be a valuable addition to anyone who has perhaps moved up to a Vic. The programs included range from simple conversion programs to 3D bit and educational games. Considering the price of many books these days, you could do a lot worse than trying this one.

After the arcade

Book: *Working With Kay*

Author: Randall McMillan
Publisher: Camdex
Cost: £7.95

Reviewed: Shari Rose

When arcade games began to lose their thrill, when the thought of tapping yet another coin began to pall, most users were torn between more serious applications. Perhaps the most common answer was to switch to word processing. For 64 users, this generally means Kay Series, which is Camdex's own word word processor for the 64

in *Working With Kay*. Series, Randall McMillan adopts a straightforward approach, encouraging the reader to start word processing immediately and learn by doing. All the basic commands are here, from inserting and deleting text to mail merge and page set. There is even a sample letter from Mark Corrigan to J.R. Irving — Randall McMillan must be a Dallas fan!

This book will be more useful for beginners than for experienced users, but there is something for almost everyone. The only real criticism is that the section on printers and print effects is rather skimpy, but then it is a topic which deserves a book in its own right.

Advanced handbook

Book: *The Advanced Commander 64 Handbook*
Author: Peter Lupton and Roger Robinson

Publisher: Century
Cost: £6.95

Reviewed: Phil Sawyer

If an answer you are an experienced user of a 64, who is proficient in Basic and would like to go further. You have mastered Camdex's

Programmer's Reference Guide but find parts of it too technical. You would particularly like to experiment with sound and Hi-res graphics, in Basic and Assembly, in order to use the basic language and to add a few more commands to Basic. The trouble is that you have been unable to find a suitable book to cover you.

Look no further! This superb volume is the very thing you need. Introduced to a companion to the *Commander 64 Handbook* by the same authors, it stands on its own as a well written, informative and useful volume for any 64 owner's bookshelf. As well as covering the points mentioned earlier, it provides a comprehensive guide to the use of disks and printers as a means for superior to Camdex's own offerings. Add to the numerous listings of program examples and advice, and you have a publication which is hard to resist.

This is indeed a book to dip into at random and explore in depth. It is packed with information presented clearly and logically, with several helpful appendices. It would almost be worth it for the 16-bit resident alone. My only criticism is of the index, which is partially incomplete, but compared with the rest of the book, this is a minor criticism. Highly recommended!

Learning with Adventures

Book: *Learning With Adventures*
Author: Rosetta McLeod
Publisher: Melbourne House
Cost: £6.95

Reviewed: Jeremy Simon

Computers in education is a theme shared planet. While computers are often used in schools, it is usually for administration or computer studies. There are surprisingly few resources where computers are used in English, geography or history.

However, Rosetta McLeod has set out to show how computers can be used to teach a variety of skills including logic, use of English and map drawing.

Commenting on how commercially available software — *The Hobbit*, *Patch*, *The Quest* and

Swivel — Rosetta McLeod explains how parents and teachers can get stories and texts which draw on popular computer programs. For example *Worm* a review of *The Hobbit* for inclusion in a computer magazine.

The book is illustrated with pictures and examples taken from Rosetta McLeod's pupils in *Adventures*. An extremely interesting and worthwhile book, at a little price of £6.95.

Two out of five for Rosetta McLeod

Standard abbrev.

WHEN TYPING in a program recently I discovered that standard abbreviations used in BASIC manuals/procedures suggest that command reader when typed "P DATA" gives not POKE but PDATA for command. How and why does it happen? And can Turbo-loading programs such as a Fastback damage the computer in any way?

I Don't Know
ALL UNPRINTED characters after a ROM will be correct, but may be avoided by shifting these keyboard characters which produce graphics when shifted are interpreted as letters, and converted into keywords. You can avoid this by placing the cursor within quotes.

Thus when you enter P (SHIFT) O, the P is unchanged and the shifted O is converted into the keyword DATA. On other CEM machines the conversions may be different. However, if you use a line (as the 64 as my sister does I mention) such as "B ROM:addr" E, then all data after the shifted E will vanish, and the error message "Syntax Error" will appear when listed.

I haven't heard of any damage being caused by such mistakes, although I haven't tried the Fastback program you mention.

Restore line

I HAVE a book called *More Basic Computer Games*, and cannot make the longest game work because of two RESTORE (line number) commands. I've tried a number of different ways of entering these commands, but my 64 won't accept them. Can you help?

I Do!
West Tilbury

SOME Basic have the command "RESTORE" line number" — CEM Basic does not. The data pointer is set to that line, and in the current DATA statement is in the case in Commodore Basic. You will have to amend the READ number, and also set a marker as the first line of DATA on the line you wish to RESTORE.

WILL YOU let me know if there is any hardware available which will let me use a Commodore 64000 disk drive and printer with my 64?

padded! I have a pair lying around the house doing nothing because I don't understand how to use them! **Answer:** **Booklet:** **Clasp**

THE BENTON for using paddles is rather long and comprehensive some machines read. You'll find it listed and explained on page 361-367 of the Commodore 64 Programmers Reference Guide.

Finding the address

IN THE August issue of *Commodore Horizons* there was a program called ADDRESS by Chris Payne in order to get the program to work effectively, large amounts of data need to be stored on tape. Could you make some suggestions on how to arrange and store the required amounts of data, or suggest some books which explain data handling in full? **I'll Propose:** **West Bromwich** **Midlands**

Business Applications for the Commodore 64, by James Hall, published by Spectrum, should be of great help to you. It contains programs and explanations which deal with data handling both on disk and tape.

Flashes and crackles

I HAVE recently purchased a Vic 20 for my son, and have been picking up instructions on the screen, showing up as short flashes and crackles. The TV and the computer itself appear to be OK, but as we are about half a mile away from a Flimsy factory it seems that the Vic is picking up some sort of signal. Can you suggest any way to shield or insulate it?

TRY A large plastic plug which eliminates voltage surges on the mains. This could be caused by your living on the same street as Flimsy's, or a local hospital, or even other electrical appliances on your own house. You can obtain such a plug for £11.00 from

Southgate EMP Ltd of
Strevens Road, Bingley,
West, WVS 2JH

Expander in print

I HAVE RECENTLY purchased a Vic 20 with Super Expander, and I find it very hard to find any programs utilizing the expander. Could you suggest any books? **I've Searched** **Flimsy** **Sentry**

YOU CAN find many programs using the Super Expander in a book called *Vic Graphics* by Nick Hargreaves, costing £6.95 from **Darkwatts, The Old Place** **Factory, 43 Glenwater** **Carrots, London.** All the programs in the book are also available on cassette from the publishers.

Cobol query

I AM A relative newcomer to the world of computers, but I anticipate going to college later this year to take a **business course**

I've been told that it would be a help if I could gain some experience in Cobol, but I can't trace a supplier of a version of the language. Can you help?

Michael Fox
Staplebury
London

COMOL on the 64 could only be used in conjunction with the new Commodore CP-M expander system which allows access to a wide range of business programs, and you should be able to find a suitable version of Cobol once this cartridge is fitted. Unfortunately, at the time of writing, no firm release date has been set for the Commodore CP-M cartridge.

If you need help with a technical query or problem write to **Jack Cohen,** **Commodore Horizons,** **13-15 Little Newport** **Street, London.** **W2R 3LQ**

COMPETITION CORNER

Eureka!

Win one of ten CURRAH Speech 64 units

ARCHIMEDES, the latest media revolution, is the inspiration for this competition sponsored by **Currah**, the company responsible for the remarkable new media advertisement *Eureka!*

Ten prize-winners will receive Currah Speech 64 voice synthesizers, for the Commodore 64. This unit, reviewed in last month's *Commodore* magazine, "speaks" in four different voices and can

be programmed to read or produce any words you want.

Since the prize is so valuable, the competition is all about words — how many English words of four letters or more can you make from the name **ARCHIMEDES**?

No proper names, plurals, or abbreviations are allowed. When you've completed your list, fill in the competition

form and post it to the address given. Don't forget to include the top-breaker at the end, assuming that original entries are 10 words or less.

The ten winners who give the longest correct list of words will win the speech synthesizers.

Usual competition rules apply, and the Editor's decision is final. Closing date is the last working day of December.

MR. WIZ

£7.95

From the author of Pety Penguin, Mr. Wiz is a superb arcade type role-game. Guide Mr. Wiz around the garden to eat the cherries whilst avoiding the evil gnomes. The gnomes can be killed by dropping apples on them or by throwing the crystal ball. Extra points can be gained by eating the magic mushrooms, but beware - this is the home of the gnomes and makes them permanently furious! (KEYBOARD OR JOYSTICKS)

◆◆◆NEW RELEASE◆◆◆

"MR. WIZ" IS ALSO AVAILABLE FOR THE S.A.C. MICRO AND ACORN ELECTRON, AND "WORLD GEOGRAPHY" IS AVAILABLE FOR THE ACORN ELECTRON. ALL CASSETTES ARE £7.95 INCLUDING VAT AND P.&P.

WORLD GEOGRAPHY £7.95

Two excellent educational programs which make learning geographical facts enjoyable and stimulating. **WORLD GEOGRAPHY** covers 166 countries pinpointing each on an accurate high-resolution screen map of the world. The countries are divided into 6 categories of difficulty, and the program tests your knowledge of capitals and populations. **U.K. GEOGRAPHY** tests your knowledge of the towns, counties, mountain ranges and islands in the United Kingdom. You can choose whether to attempt to name the places as they are indicated on the high-resolution map of the British Isles, or to find the location of places given by the program. Two entertaining and informative programs.

THE BIG THREE

THREE ESSENTIAL PACKAGES CAN BE YOURS FOR WELL UNDER THREE FIGURES!

DATABASE

Micro Macpie for the Commodore 64 is probably the most advanced database management system available for any home market. With Micro Macpie you can create a database system tailored exactly to your own information handling requirements.

With most database systems, you enter only one value per record in Micro Macpie you can record it in many places, thus linking different files, performing calculations on numerical data, print out reports, and handling data in graphical form. Only Micro Macpie can give you all these features.

- Fully user-programmable database management system
- Operated by easy-to-use keypad menus using just one key
- 100% flexible table program for spreadsheet computations
- Can perform complex calculations on numerical data
- Handles an arbitrary field width and part field matching
- Works with one or two 84k disk drives
- Horizontal or vertical bar graph or raster graph output
- Integral Command interface for parallel printer option
- Professionally written instruction manual
- Help readily available from help file
- Five sophisticated options: finding and using Search Command

Micro Macpie would be the first value if you bought it for the applications alone! You can have a highly sophisticated Macpie Ltd system up and running within minutes and you'll still be using only a fraction of Micro Macpie's potential! Once you start looking your own custom applications, you will begin to discover why Commodore Users Magazine called Micro Macpie "the software kingpin of the year."
